うーむ、、、日本語のサイトで「SAML認証連携」って書いてあったからツッコミいれようかなと思ったら、原文も"SAML federated authentication"だった件。うーむ。。。

The full code for this blog, including [SAM templates](#)—can be found at the [sam-ljs-serverless-sample](#) GitHub repository. We highly recommend you use the SAM templates in the GitHub repository to create the resources, optionally you can manually create them.

Want to enable SAML federated authentication? You can use the AWS platform to exchange SAML assertions for short-term, temporary AWS credentials.

When you build enterprise web applications, it is imperative to ensure that authentication and authorization (AuthN and AuthZ) is done consistently and follows industry best practices. At AWS, we have built a service called [Amazon Cognito](#) that allows you to create unique Identities for users and grants them short-term credentials for interacting with AWS services. These credentials are tied to roles based on IAM policies so that you can grant or deny access to different resources.

In this post, we walk you through different strategies for federating SAML providers with Amazon Cognito. Additionally, you can federate with different types of identity providers (IdP). These IdPs

認証に関する課題

- 流行りの認証に自分を預けていいか？
 - 生体認証……
 - 歩容はリスクベース認証？
- 結局マルチファクター必要？
 - 最後は「記憶」
 - それって「パスワード」が必要である、と同義？
- 認証を正しく理解しているか？
 - 二要素なのか二段階なのか二経路なのか
- **認証と認可**
